## Microsoft Security Update

Microsoft released a January 8, 2019 security update for all supported versions of Windows to fix a vulnerability in the Jet Database Engine shipped with Windows. As a result of this patch, certain Microsoft Access databases fail with a database error “unknown database format” if the database contains field names with a length greater than 32 characters. This is a known issue with the security update released by Microsoft, which they hope to have resolved in February, but have not yet provided a specific release date.

Medici contains 3 client-side Microsoft Access databases affected by this problem. These files are read only in Medici at runtime and used by Medici to provide data to the user interface, including the Medici Document Wizard. As a result of the Microsoft bug, Medici will hit this error when a user runs the Medici Document Wizard causing Medici to terminate. This issue has been resolved.

For further information, the relevant Microsoft KBs from the January 8 update are:
